WIREWAX CODE TEST

You're going to be creating a tag similar to the ones we use in both our commercial projects and the ones available through our free studio tool. Tags (or "hotspots") are the clickable points of the video that initially attract viewers and allow them to interact with the video by opening overlays or clickouts.

We've started a fiddle for you to start working in right here. Enjoy!

This is how the tag should look when it first appears.

The font used is Crimson Text, which is a Google Font available here.

The inner circle within the location marker should include a turquoise (#46E4C1) indicator that revolves around the circle to show the user how much time they have until the tag disappears from view (similar to the tag in this video).

You can find the SVG of the location marker here, and while the tag is on screen it should constantly have a pulsing effect (similar to the way the circle pulses in this video).

This is how the tag should look when any part of it has been hovered over.

The location marker icon and its pulses should change from white to turquoise (#46E4C1).
